Abstract

The point of departure of this work is an ancient and obstinate inquiry in metaphysics: if Being is not a fortuitous assemblage, wherein do the conditions of its subsistence ultimately lie? Analytical metaphysics hath contended with brute fact, the principle of sufficient reason (Leibniz 1714; van Inwagen 1983), and grounding (Fine 2001; Schaffer 2009) — yet all these disputes reduce, at bottom, to one question: is there a ground upon which explanation may truly come to rest, rather than receding evermore into further removes? This work therefore propounds 'Closure' as the candidate form of the Ultimate Ground, maintaining that only when the conditions of subsistence are recoverable within the Whole itself can Being avoid remaining in suspension.

If the Ultimate Ground is to not merely self-subsist but also to possess some primordial presence, we may provisionally name it 'Primordial Consciousness.' The 'consciousness' here is not the psychological species of mental activity, but the primordial manifestation that obtains when Being establishes itself as 'that which is.' Being and Closure, in this work's view, are not two externally imposed conditions but two aspects of one and the same ontological event; the word 'Non-Being' is herein nothing more than the name left after the failure of Closure — it is not another substance standing over against Being. As for quantum indeterminacy, Bell's Theorem, and the Many-Worlds Interpretation, this work places them only in the position of boundary discussion, functioning as collateral evidence and pressure-testing, not as primary proof of the core.

Keywords: Closure; Ultimate Ground; Primordial Consciousness; grounding; wholeness; predestination; misidentification of existential position

Prolegomenon: The Problem, Methodological Delimitation, and the Stratification of the Work

The Prolegomenon hath three matters to discharge, in fixed order: to define the problem, to account for the methodological delimitation, and to explain the stratification of the whole work. When the reader hath command of these three points, he shall, upon entering the subsequent text, be able to discern which passages constitute the core argument, which are conceptual extensions, and which are merely collateral materials for testing the theory's limits. Stratification in scholarly writing is not ornament — it is the precondition upon which reading itself may proceed.

On Methodological Delimitation and Scholarly Positioning

The methodological stance of this work may be stated in a single sentence: refuse the grand synthesis; insist upon dialogue with the problem. Theology, Buddhist philosophy, and modern physics do indeed resonate with one another, yet resonance is not identity; to compress three traditions into a single unified formula would only distort the problem-consciousness proper to each. This work chooseth rather to return each group of questions — belonging to different traditions of knowledge — to their respective positions, and then to see at which levels they may truly speak to one another.

At the level of discourse, this work distinguisheth at least three fields of differing intensity. First, it engageth directly with analytical metaphysics and philosophical theology on the questions of the Ultimate Ground, explanation, and the conditions of ontological eligibility. Second, it translates common terms from Buddhist and Christian thought into ontological language, allowing them to enter the same field of argumentation whilst preserving the sources of their respective problems. Third, it places quantum theory, Bell's Theorem, and the Many-Worlds Interpretation in the position of compatibility discussion, and doth not permit them to serve as the primary proof of the core. These three levels are adjacent but cannot substitute for one another — once conceptual translation is mistaken for doctrinal restatement, or scientific materials are misemployed as ontological proof, the entire chain of argument collapses.

The Stratification of the Work and Directions for Reading

The work is divided into five strata, the structure corresponding to the descending strength of argument. The first stratum is the theoretical core: the Ultimate Ground, self-subsistence, and the conditions of Closure — the propositions therein are of the highest strength. The second stratum passes into metaphysical extension: Primordial Consciousness, wholeness, and partial manifestation — these consist principally in defensible strong-candidate interpretations, not in strict deduction. The third stratum addresseth compatibility and limits: scientific interpretation, principal objections, theoretical constraints, and falsification conditions — its function is to test the boundary of the framework, not to vouch for the core propositions. The fourth stratum is cosmic narrative and religious translation, exhibiting the possibility of conceptual congruence without bearing ontological proof. The fifth stratum is the theoretical application: ethics, suffering, faith, and liberation — exhibiting the framework's explanatory power, yet not reversely proving the core propositions.

This is not merely an arrangement of layout. Should the anterior stratum fail to hold, the exhibition of the posterior stratum loseth its foundation; however rich the posterior stratum may be, it cannot repair the weakness of the anterior. Wheresoever the reader discovereth a difficulty, he ought return to the argument of the corresponding stratum, and not borrow the persuasive force of another.

A Glossary of Core Concepts

The table below serveth for the rapid location of terms throughout the work. The column 'Argumentative Strength' distinguisheth axiom, inference, conceptual definition, and narrative translation, so that the reader, before entering the Prelude, may first grasp the skeleton of the whole. The column 'Common Misreadings' in each row marketh the categorical confusion most frequently arising with each term — a caution for disciplined reading, and also an indication of the boundary between this work and existing traditions of thought.

Concept	Working Definition in this Work	Stratum / Status	Argumentative Strength	Common Misreading
Closure	The candidate form of the Ultimate Ground; the conditions of subsistence are recovered within the Whole itself, no longer borrowed outward indefinitely.	Ontological Stratum	Preferred Candidate / Inference	Circular Fallacy, or mere physical closed circuit
Primordial Consciousness	The primordial presence of the Ultimate Ground; the manner in which Being establishes itself as 'that which is.'	Ontological Stratum	Metaphysical Axiom / Best Explanation	A mental entity directly verifiable by empirical psychology
God	The philosophical name given to the cosmic Whole when it serves as the Ultimate Ground.	Ontological Stratum	Inference / Naming	A personal designer exterior to the cosmos
Non-Being	The name of failed Closure; not a second substance standing over against Being.	Ontological Stratum	Conceptual Definition	An independent anti-cosmic domain
Phenomena (相)	The borrowed manifestation of finite Being; real, yet lacking the qualification of ultimate self-subsistence.	Ontological Stratum	Conceptual Definition	Wholly illusory or pure hallucination
Misidentification of Existential Position	The structural misplacement whereby the partial misconstrueth itself as the absolute centre.	Ethical Stratum	Interpretive Concept	Mere moral transgression
The Adversary	The structural residue left by the pre-Closure bifurcation; not an evil substance coequal with God.	Ontological Stratum	Narrative-Ontological Translation	An eternal and independent second sovereignty
Predestination	The unique path of events required for the circuit to close with precision.	Ontological Stratum	Inference	External compulsory fatalism

Free Will	The individual's subjective assumption and acceptance of the ordained path — not the power to alter the outcome.	Ethical / Conscious Stratum	Compatibilist Retention	The power to overturn destiny
Pain / Suffering	Pain is structural cost; Suffering is the partial will's subjective resistance to finitude.	Conscious Stratum	Conceptual Distinction	Interchangeable synonyms
Miracle	The partial consciousness reading a rare node already inscribed in the Whole.	Ontological / Narrative Stratum	Immanent Interpretation	External correction of ordained causation
Liberation	Cognitive correction; acknowledging that one hath never departed the Whole.	Ontological / Conscious Stratum	Translative Concept	Departure from the cosmos or annihilation of the individual

A Formal Restatement (One-Page Scheme)

This page reduceth the core concepts of the whole work to a minimal symbolic skeleton. Its aim is not to prove metaphysics by mathematics, but to clarify argumentative relations, conceptual strata, and disputable points.

Symbolic Convention

U = the cosmic Whole; x = a partial being; G(x) = the set of subsistence-conditions of x; G*(x) = their transitive closure; L(U) = logical consistency; C(U) = inward recovery of conditions; A(U) = primal self-evidence; E(U) = qualification as Ultimate Ground.

Qualification of the Ultimate Ground

$$E(U) = 1 \text{ iff } [L(U) = 1 \land G^*(U) \subseteq U \land A(U) = 1]$$

True ultimate Being must at least satisfy logical self-consistency, cessation of outward borrowing, and primordial presence unto itself.

Status of Partial Being

$$\text{Phenomenon}(x) = 1 \text{ iff } [x \subset U \land G^*(x) \not\subseteq x]$$

Partial being is real, yet its conditions of subsistence cannot be wholly recovered from itself; therefore it remaineth borrowed manifestation rather than ultimate self-subsistence.

Chain of Inference

$$A(U) = 1 \rightarrow S(U) = 1 \rightarrow C(U) = 1$$

S(U) denoteth self-maintenance. If primal self-evidence obtaineth, it implieth self-maintenance; and if true self-maintenance leaveth no external residual condition, it tendeth inward toward Closure.

Predestination and Free Will

$$|\Gamma(U)| = 1; \text{Freedom_i} = \text{Endorsement_i}(\gamma^*)$$

The former signifieth that precise Closure admitteth only one finally completed path of events; the latter signifieth that freedom is not rewriting the outcome, but assuming and receiving the given path.

Pain and Suffering

$$\text{Pain_i}(t) = \text{structural cost}; \text{Suffering_i}(t) = \text{Pain_i}(t) + \text{Resistance_i}(t)$$

Awakening doth not necessarily cause $\text{Pain_i}(t) \rightarrow 0$, but tendeth toward $\text{Resistance_i}(t) \rightarrow 0$; thus one may still have pain, yet no longer the deepest suffering.

Such formalisation increaseth clarity and examinability, yet cannot by symbols alone transform a metaphysical choice into an empirical theorem.

Prelude: Three Cardinal Ontological Emendations and the Tripartite Division of Being

Foundation I God is Primordial Consciousness, Not a Personal Designer

'Primordial Consciousness' is not some higher mental unit within the cosmos, nor is it the human experience of consciousness enlarged and projected onto the Whole. It designateth a necessary ontological principle: if Being is truly to subsist, then at the most fundamental level there must exist a ground capable of self-manifestation, self-maintenance, and the encompassing of the Whole. This work employeth the word 'God' to provide a philosophical name for this ultimate principle — not to reconstruct a personified designer.

This work deliberately retaineth 'Primordial Consciousness' rather than substituting 'primordial self-subsistent directedness' or 'subjectless structure,' for an evident reason: what is to be preserved here is not merely abstract self-sufficiency, but the subjectivity of the Whole's self-knowledge, self-subsistence, and self-return. This course hath a proximity to Spinoza's understanding of God as the sole substance, yet there is a fundamental difference: this work doth not reduce the Ultimate Ground to a necessary structure devoid of subject. The two are related, yet they cannot be directly equated.

Foundation II Being and Closure Are Two Aspects of One Ontological Fact

> ***【Proposition 2】 Being and Closure are two aspects of one and the same ontological fact, not conditions separated in succession.***

Being and Closure are not two conditions separated in succession but two aspects of one and the same ontological fact. Whatsoever truly subsisteth is necessarily a Being that hath achieved Closure; whatsoever cannot achieve Closure cannot in the end maintain itself and slideth finally toward Non-Being. The 'simultaneous subsistence' spoken of here is an ontological necessity, not a synchrony in temporal order — this distinction must be strictly kept, lest the entire ontological structure be infected with unnecessary temporal presuppositions.

Foundation III Non-Being is Naught but the Name of Failed Closure, Not an Independent Substance

'Non-Being' in this work is not a second substance that may be set alongside Being; it is only the name left when Closure hath failed to be completed. This definition is framed so as to preclude a common ontological error: the re-substantification of a state of failure, as though there existed beyond the cosmos some domain standing over against Being.

What is called the 'God of Non-Being (the tendency toward dissolution)' in the Pre-Cyclical Epoch is a personalised explanatory device for 'the internal bifurcation within Primordial Consciousness between that which can subsist and that which cannot' — it describeth not two forces contending against each other, but the internal sifting that Primordial Consciousness performeth in establishing itself: structures that are self-consistent remain (Closure); those that are not lose their qualification (Non-Being). Once this bifurcation is complete and the circuit closeth, the tendency toward dissolution vanisheth utterly; what thenceforth continueth to operate in the cosmos is naught but the structural residue left by that bifurcation — the Adversary, entropy, quantum noise.[1]

The Tripartite Division of Being: Ontological, Ethical, and Conscious Strata

The tripartite division set forth hereunder is the reading-precondition for the whole work; the force of any proposition in any passage must be judged according to the stratum to which it belongeth.

The Supreme Ontological Stratum

At the supreme ontological level, the question is not good and evil, not morality, not retribution, not partial destiny — there is but one question: can this Being achieve Closure and abide eternally? If it cannot, it slideth toward Non-Being. At this level there is only the distinction between 'Closure' and 'Non-Being'; there is no distinction of good and evil. 'True evil' at the supreme level hath but one face: Non-Being, dissolution, failure of Closure.[2]

---

[1]The 'God of Non-Being' in this work is narrative-anthropomorphic language and ought not be understood as a second substance; its structure approacheth more the course of understanding evil as a privation of good and Being. For related discussion, see Augustine; Plotinus; Stump.

[2]The designation of 'true evil' as an internal term of the supreme ontological stratum doth not cancel the judgements of the ethical world regarding violence, injustice, and suffering. For the problem-domain of evil and theodicy, see Ekstrom; Tooley.

The Partial Ethical Stratum

Good and evil, blame, judgement, punishment, law, and remorse all pertain only to the necessary mechanisms of the partial level — they are not the ultimate reality of the supreme ontological level. At the level of ultimate ontology there is only the distinction between Closure and Non-Being; good and evil and judgement are administrative instruments of the partial level, employed to maintain the internal order of Closure — they are not the final adjudication of the cosmic substance.

The Subjective Conscious Stratum

Pain, suffering, trauma, remorse, contrition, the sense of being redeemed, the sense of loss — all these pertain to the reading and endurance of the partial consciousness at its finite position. The experiences of this level are real, yet their ontological status is partial and doth not equate to the judgements of the supreme ontological level. To elevate the immediately felt experiences of the conscious stratum to the ultimate reality of the ontological stratum is the most common variety of readerly misplacement.

Part the First

The Theoretical Core

The Ultimate Ground, Self-Subsistence, and the Conditions of Closure

---

This Part concentrateth upon the most central arguments of the whole work: the Ultimate Ground, self-subsistence, the conditions of Closure, and hierarchical ontology. It first seeketh the definition of concepts, then ordereth the argumentative sequence; the strength of the propositions herein is the highest in the entire work.

Chapter the First The Problem — Whether Being Requireth an Ultimate Ground

I·I The Point of Departure

Any system of ontology, pushed deep enough in its questioning, will at last encounter one and the same problem: why is there something rather than nothing? This is the root problem to which metaphysical dispute, passing through Leibniz and Heidegger down to contemporary analytical philosophy, hath repeatedly returned — it is no mere rhetorical opening. The structure of the problem is this: when the chain of dependence is traced backward step by step, one asketh whether there yet remaineth a position at which explanation may truly come to ground — and not merely add one more remove.[3]

In the face of this problem, the history of philosophy hath furnished at least three typical responses. First, to regard Being as a brute fact — an accomplished datum admitting of no further explanation. Second, to accept an infinite causal chain or infinite regress, letting the responsibility of explanation extend indefinitely. Third, to maintain that Being must have some Ultimate Ground capable of self-subsistence. This work taketh the third path. The starting point of the argument is progressively to shew wherein the first two approaches prove unsatisfying — not to presuppose that the third course is already established.

In terms of the history of the problem, this work intervenes directly in the dispute over the principle of sufficient reason, the Ultimate Ground, and metaphysical explanation. It neither accepteth brute fact nor reduceth the demand for explanation to a purely methodological preference; its aim is to re-advance the requirement that 'the Ultimate Ground must be capable of self-subsistence.'

I·II What It Is to Truly Account for the Subsistence of Being

What this work calleth 'truly accounting for the subsistence of Being' requireth a metaphysical explanation capable of terminating the outward push — it is not the everyday locution of 'giving an account of the cause.' Grounding here is not a subsidiary term but the problem itself: if that whereby

[3]The question of 'why there is something rather than nothing' is in twentieth-century metaphysics commonly regarded as the classical gateway into the problem; its representative formulation may be found in Heidegger; for an overview of the contemporary cosmological argument, see Reichenbach.

something subsisteth always borroweth another premise not yet accounted for, then what we obtain is merely one remove in the chain of explanation and we have not yet arrived at the ground.[4]

I·III 'Nothingness' is but an Extreme Appellation, Not a Prior Domain

This work doth sometimes employ the locution 'from nothing to something,' yet the 'nothing' here is not something or some state prior to and subsisting before Being — it is merely an extreme appellation for Being as yet unestablished. 'Nothingness' was never truly a pre-cosmic domain; it is only when thought, in inquiring how Being cometh to subsist, is forced to this conceptual limit that the notion ariseth. This definition is framed so as to seal entirely the fissure of 'substantifying the void' — for once 'nothingness' is understood as some kind of reality, it is itself already a species of Being, and the inquiry hath turned back upon its starting point.

[4]For the basic definition of metaphysical explanation and grounding, see Brenner; Bliss and Trogdon.

Chapter the Second Against Brute Fact and Infinite Regress — True Being Must Be Self-Subsistent

II·I The Fundamental Defect of Brute Fact

The fundamental difficulty of the brute fact position lieth not in what it asserteth wrongly but in its concealment — rather than genuine elimination — of the need for explanation. If Being hath wholly no ground of subsistence, it is logically equivalent to that which may fail to exist; that such a thing existeth at all is itself in need of explanation. To treat Being as a brute fact is to declare the inquiry stopped at a certain point — this is an epistemological decision, not a metaphysical resolution.[5]

II·II The Fundamental Defect of Infinite Regress

If within a Whole there existeth no truly self-subsistent ground, then however infinite the layers of support, the Whole remaineth suspended. The crux is whether within the Whole there obtaineth a self-subsistent ground that hath truly come to rest — the length of the chain is immaterial. An infinite chain doth but replicate the state of suspension infinitely; the increase in number doth not of itself confer self-subsistence.[6]

> ***【Proposition 4】 Neither Brute Fact nor Infinite Regress can truly account for the subsistence of Being; the Ultimate Ground must possess some self-subsistent structure whereby the responsibility of explanation is no longer borrowed outward.***

II·III The First Proposition

> ***【Proposition 1】 If true Being is to serve as the Ultimate Ground, it must at least in principle be capable of self-subsistence.***

This proposition is not a description of Being but the setting of qualifying conditions for 'that Being which can serve as the Ultimate Ground.' It excludeth brute fact and infinite regress, requiring that

[5] To regard brute fact as insufficient to terminate the responsibility of explanation is closely connected with the problem-domain of grounding and the strong demands of the principle of sufficient reason. See Bliss and Trogdon; Melamed.
[6] The reason that infinite regress cannot truly complete explanation lieth not in the length of the chain but in its never providing a self-subsistent terminus; for a related overview of the cosmological argument, see Reichenbach.

Being possess some structural feature whereby the responsibility of explanation is no longer borrowed outward. This is precisely the starting point for the introduction of 'Closure.'[7]

[7]Herein the Ultimate Ground is defined as requiring at least the in-principle capacity for self-subsistence — a strengthened formulation of the problem of PSR and metaphysical explanation. See Melamed; Brenner.

Chapter the Third Wherefore Self-Subsistence Pointeth toward Closure — A Preferred Candidate for the Ultimate Ground

III·I The Definition of Closure

What this work calleth 'Closure' must first be strictly distinguished from the circular fallacy in argument. The two are superficially similar in form yet wholly different in function: the circular fallacy operateth at the level of inference and consisteth in an argument's covert use of the very conclusion it seeketh to establish; the Closure of this work pertaineth to existential structure and referreth to a Whole whose conditions of subsistence can in the end be recovered within itself without further borrowing outward. The crux is not whether the reasoning hath traced a circuit, but whether Being hath truly come to ground.

Were one to borrow the vocabulary of contemporary systems theory, one might provisionally understand the 'Closure' of this work as a Whole that is operationally closed yet capable of self-reproduction; yet how a cell maintaineth its metabolic boundary, or how an institution perpetually re-enacts itself through documentary process — these are not the questions this work asketh. Whether the Ultimate Ground can in principle recover its own conditions of subsistence — that is the core.[8]

As regards argumentative strength, 'Closure' is more aptly understood as the preferred candidate for the Ultimate Ground than as the sole path already sealed by deduction. Compared with brute fact, infinite regress, or pure dead structure, it is better able to handle three matters simultaneously: how the ground is self-subsistent, how the Whole encompasses the partial, and how partial experience remains traceably connected to the Whole. Strictly speaking, this is still a judgement based upon comparative explanatory power, not a theorem already sealed in proof.[9]

[8]The borrowing of systems-theoretic vocabulary for an ontological analogy here hath a structural resonance with the autopoiesis advanced by Maturana and Varela and with the operational closure of social systems as described by Luhmann; yet what this work asketh is not how a cell or an institution maintaineth itself but how the Ultimate Ground in principle returneth to itself. See Maturana and Varela; Luhmann.

[9]This work defineth 'Closure' as preferred candidate rather than theorem; this judgement approacheth treating the problem of the Ultimate Ground through comparative explanatory power and inference to the best explanation. For related discussion, see Melamed; Douven.

III·II Self-Delimitation and Difference are Necessary Conditions for Closure

> ***【Proposition 3】 True Being is not merely Unity; it must abide eternally as a self-delimiting Whole capable of return.***

This sentence is the watershed between this work and a simple identity-monism. If the Whole hath no difference whatsoever, there is no position; without position there is no relation; without relation there is no return; without return, Closure can scarce be formed. The partial, difference, and limitation are, within this framework, necessary conditions for Closure — they constitute no manner of fall or deficiency. The Whole, through self-delimitation — by permitting internal differentiation and difference — completeth its own Closure. This argument hath weighty implications for theodicy: finitude and suffering are the structural costs of Closure that cannot be circumvented — they are not defects of design.

III·III The Status of the Non-Closed: Demoted to 'Phenomena (相),' Not Fictitious Being

Whatsoever cannot recover its own causal conditions can only subsist transiently or by borrowed tenure — it doth not count as Being truly completed. This work doth not deny the reality of finite things but placeth their ontological status precisely as 'Phenomena (相)' — the borrowed manifestation of the Whole at partial positions. Flower, man, and star are all real 'Phenomena (相)'; they are not unreal, yet they are not 'Being completed.' To borrow a Buddhist analogy: all that hath form abideth only transiently; solely the Whole of Closure is Being truly completed. This borrowing is a cross-traditional translation, not a word-for-word transplanting of the original Buddhist semantic.[10]

III·IV Closure Returneth at Last unto Being Itself

What Closure ultimately pointeth toward is Being's return to itself as 'that which is,' no longer dispersing, no longer suspended, no longer borrowing — this already surpasseth the mere image of head and tail joined. The unfolding of the cosmos is the process by which Being, in the very act of unfolding,

[10]The Buddhist term 'Phenomena' is borrowed here with the emphasis on marking the borrowed subsistence of finite Being; the usage is a cross-traditional translation and is not equivalent to a word-for-word transplanting of original Buddhist semantic. See Siderits; Coseru.

proveth and confirmeth its ability to return unto itself. Time is the internal mode of reading this process — not a prior framework of the cosmos.

III·V The Three Levels of Closure

Closure in this work is not a single concept but a layered progression. Logical Closure referreth to the self-consistency of the propositional system — necessary but insufficient. Causal Closure referreth to the complete internal accounting within the Whole of Being for its causal conditions. Self-Evident Closure is Causal Closure augmented by primal self-evidence. If the cosmos is to serve as the Ultimate Ground, it must simultaneously satisfy the latter two levels.

III·VI Logic is Prior to Causality: The Hierarchy of Foundational Theory

The hierarchical structure of ontology must be made clear: the law of causality is the skeleton within time, describing how the cosmos 'operateth in time'; the law of logic is the necessity transcending time, describing 'what can in principle subsist.' Logic is not an external rule imposed upon God but the self-consistency constitutive of God's nature. Self-contradictory Being cannot achieve Closure and thus cannot truly subsist. This distinction freeth the present theory from the interference of temporal causal paradoxes, inasmuch as the ultimate guarantee of Closure is logical self-consistency, not physical causation alone.

Part the Second

Metaphysical Extension

Primordial Consciousness, Wholeness, and Partial Manifestation

---

This Part continueth from the foregoing core argument, passing into metaphysical extension. What is advanced hereafter consisteth in defensible strong-candidate interpretations, not in strict deductions already completed.

Chapter the Fourth Wherefore the Ultimate Ground Cannot Be a Dead Structure Alone — Primordial Consciousness and Primal Self-Evidence

IV·I The Problem of Dead Structure and the Spinozist Boundary

> ***【Proposition 5】 If the Ultimate Ground is wholly without self-knowledge, it remaineth merely a dead structure and doth not count as truly self-possessed.***

If the Ultimate Ground is wholly without self-knowledge, it remaineth merely a dead structure — the notion of its being truly self-possessed doth not arise. A purely material closed structure may be 'closed' in its function, yet it remaineth a blindly operating mechanical system; it accounteth for how the cosmos 'continueth,' yet it doth not answer why the cosmos 'is truly present.' Here one must draw a clear boundary against the pantheist mechanical cosmos. This work hath a proximity to Spinoza's monism of the form 'God is Nature': both understand God as the sole substance rather than a designer exterior to the cosmos. Yet this work seeketh to preserve the stratum of primordial subjectivity — the Whole's self-knowledge, self-subsistence, and self-return — whereas the Spinozist system inclineth more toward a necessary structure devoid of subject. The two are adjacent; they cannot be directly equated.[11]

IV·II Primal Self-Evidence: Being's First Self-Establishment

'Primordial Consciousness' may be provisionally defined as the primordial presence manifesting when Being for the first time establisheth itself as 'that which is.' The 'first' here is not the earliest moment in time but the lowest foundational layer in the argument — the moment of self-manifestation, prior to all further differentiation, whereby 'that which is' becometh distinguishable from 'that which is not.' What is spoken of is the self-manifestation prior to the differentiation of subject and object — not the species of cognitive activity in which 'a subject knoweth an object.' What is truly at stake is the presence (presentia) of the Whole — not consciousness of something, but the primordial occurrence of consciousness itself as the manner in which Being manifesteth itself.[12]

---

[11]Here a family resemblance is maintained with Spinoza's single-substance theory, yet this work still refuseth to reduce the Ultimate Ground to a necessary structure devoid of subject. See Spinoza.

[12]The inference from structural self-sufficiency to primordial presence approacheth more inference to the best explanation and the metaphysical choice of the priority of the Whole than a purely deductive conclusion. For related discussion, see Douven; Schaffer; Goff, 'Panpsychism'; Shani.

IV·III The Justification of Metaphysical Choice — Wherefore Dead Structure Sufficeth Not for Self-Possession

The step from 'Causal Closure' to 'Primordial Consciousness' is a metaphysical choice, not pure deduction. If the Ultimate Ground possesseth no self-evidence whatsoever, what is called 'self-subsistence' reduceth to a description added by an external observer — Being itself hath not truly come forth. As regards the argumentative strength this work is presently able to achieve, this remaineth at the level of axiom, not a proposition already fully proven.[13]

The inference here adopted is inference to the best explanation: if the Ultimate Ground is both to terminate the outward push and to explain why the first-person presence of partial subjects, value-judgements, and religious/transcendent experiences possess continuing directedness, then understanding the Whole as a ground possessing primordial presence will have greater integrative power than a purely subjectless structure. This work only maintaineth that this is a stronger candidate; it doth not assert that it hath been logically established beyond necessity that the cosmic Whole possesseth subjectivity.

IV·IIIa From Partial Presence to Whole Primal Self-Evidence — A Motivational Supplement to Primordial Consciousness

There is a further motivational thread in support of 'Primordial Consciousness' that deserveth mention. This work doth not assert: simply because the cosmos is vast in scale, or because partial life hath evolved consciousness, one may directly infer that the cosmic Whole must necessarily have consciousness — that inference moveth too swiftly and cannot bear the ontological weight. What this work truly seeketh to shew is this: since first-person presence hath already truly appeared within the cosmos, to presuppose the Ultimate Ground as a dead structure wholly without presence would itself require additional explanation — how can partial consciousness possibly emerge from a purely third-person, blindly operating structure? In this respect, this work doth not enlarge partial mind directly into cosmic mind but

[13]This passage explicitly adopteth inference to the best explanation rather than formal deduction; for related methodology, see Douven; Lipton.

maintaineth rather: the Whole ought not lightly be understood as a purely dead structure wholly devoid of presence.

This work also doth not presuppose that consciousness must await extreme complexity before it can suddenly arise. Even without directly calling slime moulds or other extremely simple systems 'conscious,' the directedness, discriminatory capacity, and self-maintaining tendency they exhibit at least suffice to weaken an over-strong presupposition: that consciousness can only burst forth ex nihilo in the midst of extreme high-order neural complexity. If so, what truly needeth answering is not 'whether the cosmos is large enough to produce consciousness' but 'how first-person presence can arise from a purely subjectless, blindly operating structure.' In this sense, this work doth not enlarge partial mind directly into cosmic mind but maintaineth rather: once Closure is understood as a self-returning, self-maintaining, self-manifesting Whole, to understand it as tending toward primordial presence is less incongruous than to understand it as wholly blind dead structure. This point may also receive supplementary support from the relation between Whole and part. Higher-order wholes are often not mere sums of their parts; the position, function, and intelligibility of the parts often requireth the Whole-structure for their establishment. If so, to understand the cosmos as a Whole prior to and encompassing the partial, manifesting itself through partial consciousness, is not mere philosophical imagination. What this work taketh here is not a visual analogical proof but a structural intuition of the priority of the Whole over its parts: if partial consciousness is not an absolute alien in the cosmos, it is more likely the low-resolution manifestation of the Whole at a partial position than an accidental exception emerging ex nihilo from a purely blind structure.

The regularity and legibility of the cosmos also furnisheth a weaker yet not negligible auxiliary motive. Regularity is not of itself consciousness, nor doth order necessarily entail purpose; yet the cosmos not only persistently presenteth stable structure but can also be repeatedly read by partial consciousness through mathematics, logic, and theory — this maketh 'how Being manifesteth itself as intelligible' an inescapable question. If the Ultimate Ground were merely a purely blind dead structure, this very intelligibility and legibility would itself be the harder thing to explain. Compared with this, to understand the Ultimate Ground as a Whole somehow primordialy self-evident and primordialy

present, though not achieving deductive necessity, is better able to integrate the three: partial consciousness, the cosmic legibility, and the Whole's self-return.

As for the mythological and symbolic language of various intellectual traditions — 'the world as dream,' 'all things from the same root,' 'the Whole and the partial mutually mirroring each other' — this work regardeth them only as historical echoes of this intuition and doth not treat them as core evidence. Their function is to shew that the history of human thought hath repeatedly touched upon the sense of the problem that 'partial consciousness and the Whole of Being may share the same root' — not to furnish ontological proof for this work.

IV·IV The Chain of Inference

> ***【Proposition 11】 Once primal self-evidence is established, it containeth self-maintenance; and if true self-maintenance leaveth no external residual conditions, it must necessarily converge inward into Closure.***

If partial first-person presence is not a gratuitous exception in a purely blind structure but is better understood as the manifestation of the Whole within the partial, then to understand the Ultimate Ground as a closed Whole possessing primal self-evidence is not merely arbitrary naming but possesseth considerable integrative power. The chain of inference of this work is: if true Being is to be self-subsistent, it cannot be merely a blind accumulation of facts; if primal self-evidence obtaineth, it implies at least some self-maintenance; and if self-maintenance leaveth no external residual conditions, it tendeth to converge into Closure. In this respect, this work regardeth 'the self-evidently closed Being' as an integral formulation of the Ultimate Ground — not as a theorem already fully formalised in proof. Each step in the chain preserveth space for further disputation.

Chapter the Fifth The Identity of Primordial Consciousness with the Cosmic Whole — Wholeness, Partial Manifestation, and the Philosophical Naming of God

V·I Wherefore Primordial Consciousness Cannot Be Merely Partial

> ***【Proposition 6】 If Primordial Consciousness is the Ultimate Ground, it cannot be merely partial; it can only be identical with the cosmic Whole itself.***

The partial is wholly determined by the Whole; therefore the partial cannot serve as the final ground. However complex and however self-sufficient a partial may be, so long as it existeth within the Whole, its conditions of subsistence include the determination imposed upon it by the Whole. The partial cannot explain the Whole, for it hath itself already presupposed the Whole. This driveth the position of 'Primordial Consciousness' out of every partial node and placeth it in the Whole itself.[14]

V·II The Philosophical Definition of God

This work defineth 'God' as the name given to the cosmic Whole when it serveth as the Ultimate Ground; if this ground is to subsist, it must at least possess the characteristics of self-evidence, self-maintenance, and mutual determination of beginning and end. This course is capable of dialogue with Paul Tillich's understanding of God as 'Being itself' rather than 'a being,' and also engageth with Plotinus's doctrine of the One and certain versions of contemporary process theology. Yet this work in the end taketh the closed Whole and Primordial Consciousness as its core and is not annexed by any single tradition.[15]

---

[14] To understand the partial as determined by the Whole and incapable of self-grounding approacheth the problem-consciousness of priority monism. See Schaffer, 'Monism: The Priority of the Whole.'

[15] Herein defining God as the ground of Being rather than a being hath an evident relation to Tillich's ontological theology; the difference from Spinoza lieth in this work's preservation of primordial presence. See Tillich; Spinoza.

V·III Omniscience and Omnipotence Pertain to the Totality, Not to the Partial Phenomenon Itself

> ***【Proposition 7】 Omniscience and omnipotence pertain to the Totality, not to any partial node; the finitude of man is the cost that the Whole must necessarily bear in completing Closure.***[16]

Traditional theology hath a recurring perplexity: if God is omniscient and omnipotent, wherefore is man finite, fallible, and suffering? Within the framework of Closure, this question hath a clear structural answer: omniscience and omnipotence pertain to the Totality, not to any partial node. Partial consciousness is the manifestation of the Whole at a certain position; it doth not possess the full function of the Whole. The finitude of man is the cost that the Whole must necessarily bear in completing Closure — it is not God's failure.

V·IV The Status of Logic: The Ontological Self-Consistency of God

Logic is not an external rule imposed upon God but the self-consistency inherent in the Primordial Consciousness itself. Logic is rooted in the ontological self-consistency of the Primordial Consciousness; God is not subject to logic — God is the very source wherefrom logic deriveth its subsistence.

[16] Attributing omniscience and omnipotence to the Totality and understanding the partial as finite manifestation hath a philosophical-historical analogy with the Neoplatonic emanation-structure from the One to multiplicity. See Plotinus.

Part the Third

Compatibility and Limits

Science, Experience, and Theoretical Constraints

This Part concentrateth upon the materials most readily misread and most readily over-mobilised: scientific interpretation, principal objections, theoretical limits, and falsification conditions. Their function is to test the framework's boundary — not to vouch for the core propositions.

Chapter the Sixth The Ontological Interpretation of Quantum Mechanics — A Discussion of Compatibility and Theoretical Limits

VI·I The Strict Division of Labour between Science and Philosophy

Quantum mechanics and Bell's Theorem play, in this work, only the role of compatibility discussion and pressure-testing: they may serve to examine the limits of certain fragmentary cosmological views, yet they do not constitute direct scientific proof of the philosophical propositions of this work. Science describeth how the cosmos 'operateth'; this work inquireth why the cosmos 'is able to subsist'; the two may draw upon each other yet ought not substitute for each other. This work doth not employ any physical theory as ontological proof — it doth but use physical theory as a pressure-test.

VI·II The Ontological Interpretation of Quantum Indeterminacy

This work's treatment of quantum indeterminacy remaineth at a narrow position: it may not suffice to directly derive ontological true randomness. The 'residue' and 'noise' employed in the text are merely working vocabulary for ontological interpretation — they are not theorem-names in quantum mechanics. This work doth not maintain that quantum mechanics hath directly proven absolute predestination; rather, it maintaineth that quantum indeterminacy may not suffice to prove ontological true randomness — and therefore integral Closure-determinism remaineth a retainable ontological option.[17]

VI·III The Proper Placing of Bell's Theorem

Taking Bell's Theorem as an example, this work is more willing to understand it as: it hath at least weakened a simply local-realistic picture of the cosmos, yet it doth not suffice to directly negate all holism or all determinism. This work citeth Bell's Theorem with the purpose not of proving God or cosmic consciousness through physics, but of pointing out that when the local-fragmentary

[17]Within the domain of the interpretation of physics, superdeterminism maintaineth that initial conditions together with the choices of the measurer are together determined, and therefore Bell's Theorem doth not necessarily compel acceptance of ontological true randomness. This work employs this course only as a compatible background for dialogue; see 't Hooft; Hossenfelder and Palmer.

understanding is under pressure, the picture of the Whole as prior to its parts remaineth a retainable ontological option.[18]

Recent discussions of definite causal order also intimate that classical antecedence and sequence may not be the only available description at the quantum level; yet this at most serveth as an auxiliary background for weakening fragmentary, linear intuition — it doth not suffice to directly derive this work's singular Closure-predestination. Bell's Theorem doth not directly prove the existence of God or cosmic consciousness; it only leaveth greater ontological space for an integral cosmological view.[19][20]

VI·IV The Hypothesis of Parallel Worlds: The Falsification Boundary of the Theory

The falsification boundary of this work must be made clear: if the Everettian Many-Worlds Interpretation or a cognate scheme achieveth stronger and more stable persuasive power in physics and the philosophy of science, the settings of this work regarding 'unique predestination' and 'singular Closure' would require fundamental revision. At present, this work only methodologically treateth the cosmos first as a single closed path, employing it to examine whether the theory is self-consistent — it doth not declare that science hath already given a definitive answer to the problem of many worlds.[21]

[18]The core of Bell's Theorem and its subsequent philosophical interpretation lieth not in directly supporting any cosmic-consciousness theory but in putting pressure upon the local-realistic fragmentary picture. See Bell; Myrvold, 'Bell's Theorem.'

[19]For representative discussion of indefinite causal order, see Oreshkov, Costa, and Brukner. This work employs it herein only as a compatible background for weakening linear antecedence-intuition and doth not advance it as direct proof.

[20]Bell's Theorem impingeth directly upon local realism or local hidden-variable schemes and doth not automatically imply cosmic consciousness or absolute determinism. For related discussion, see Myrvold, 'Bell's Theorem'; Myrvold, 'Philosophical Issues in Quantum Theory.'

[21]The Many-Worlds Interpretation handleth the measurement problem through the coexistence of many worlds; it is an important interpretation yet it is not a scientific conclusion already established without controversy. This work treats it as a falsification boundary, for were this course to become more persuasive, the unique Closure-predestination would require revision. See Vaidman.

Chapter the Seventh The Echo of Objections and the Limits of Thought — Principal Objections, Distinctions of Level, and Theoretical Constraints

VII·I The Distinction of Level between Closure and the Circular Fallacy

The key distinction between Closure and the circular fallacy lieth in level: the circular fallacy is a problem at the level of inference; Closure is a structural description of the substance of Being. The complete internal accounting of the causal conditions of the Whole of Being within itself is called 'self-subsistence' — not 'circularity.'

VII·II The Boundary between Primal Self-Evidence and a Personal God

The primal self-evidence spoken of in this work is the 'self-establishing quality' of the Whole — it is no personalised cognition whatsoever. The reason it is called 'consciousness' is that it containeth the element of 'self-presence,' yet its form of presence is more fundamental than personality — it is the source of personality and in scale cannot in the least be likened to human thought or feeling. One of the strongest objections is this: the first-person experience of partial subjects may be entirely no more than a late emergence within a highly complex system — it doth not therefore require one to trace primordial presence back to the Ultimate Ground. This work acknowledgeth that this objection hath real weight; yet if partial first-person presence hath already truly appeared, to presuppose the Ultimate Ground as a purely dead structure wholly without presence may not require fewer assumptions than to understand it as possessing primordial presence. The question is not merely 'whether the complexity is sufficient' but rather: how doth first-person presence arise at all from a purely third-person structure wholly without presence? This work also doth not maintain that any simple system exhibiting directedness, self-maintenance, or discriminatory capacity may straightway count as conscious; yet such phenomena at least suffice to weaken an over-strong presupposition: that consciousness must await extreme complexity before suddenly erupting ex nihilo. If the theory of high-complexity emergence can ultimately only repeat 'it emerges when complex enough,' it approacheth the naming of a phenomenon without truly accounting for how presence itself is possible. Here especially one must strictly distinguish logical priority from temporal antecedence: the 'primal self-evidence' spoken of in this work is not the earliest conscious moment in the temporal sequence, but the lowest condition of presence, irreducible any

further, whereby Being subsisteth as 'that which is.' When Closure is not yet completed, this primordial presence can only be apprehended as a logical foundational layer; once Closure is completed, primal self-evidence and the Whole's self-awareness are in reality fully coincident — they are no longer two separable states. Hence 'Primordial Consciousness' is not an attribute later appended to the Whole but the primordial presence disclosed when the Whole returneth to itself. The more accurate formulation is: if Closure can truly serve as the Ultimate Ground, and partial first-person presence hath indeed appeared within it, then to understand the Whole as at least tending toward primordial presence hath greater integrative power than to understand it as wholly blind from first to last. This is still inference to the best explanation — not formal deduction. If Closure is first reckoned truly to exist, it cannot be merely a closed structure in the eyes of an external observer — for then it would remain only 'described as closed' and not truly subsistent in itself. If true Being is to be self-subsistent, beyond the inward recovery of conditions there must be some least self-presence: Being is not merely 'closed' for another but 'present' for itself. Were there wholly no such self-presence, so-called Closure would remain at the third-person description and would not suffice as the Ultimate Ground. Primordial Consciousness is therefore not an attribute added over and above Closure but the indispensable internal aspect of Closure as true Being.

VII·III The God of the Whole and the Ontological Placement of Evil

According to the tripartite division: at the supreme ontological level, evil hath but one form — the failure of Closure; at the partial ethical level, good and evil are necessary mechanisms for maintaining partial order — they are not the 'failure' of the cosmic Whole; at the subjective conscious level, suffering is the apportionment of Closure's cost upon partial individuals. The Closure of the Whole encompasseth all possibilities of the partial, including the process of deviation and correction.[22]

VII·IV The Wholeness of Closure and the Manner of Reading Time

It is not that time runneth its full course and then Closure subsisteth; rather, Closure first subsisteth as a Whole and time is merely its internal mode of reading.

[22]Placing evil as the deficit of order rather than a second substance approacheth the Augustinian course of privatio boni. See Stump; Tooley.

VII·V The True Weight of Ethics within the Framework of Predestination

The significance of ethics dependeth not upon the assumption that 'the outcome could have been otherwise' but upon the true weight of the partial consciousness as it endureth, judgeth, and accepteth the events it hath undergone. Free Will in this work's framework is the form of assumption of the ordained path at the subjective level — not the power to rewrite the final outcome. The weight is real.[23]

VII·VI The Boundary of Division between Science and Ontological Propositions

The ontological propositions of this work pertain to the philosophical level — not the scientific. Science may furnish auxiliary analogies yet cannot directly falsify or verify the core propositions of this work. The scientific development closest to 'threatening this work' would be the establishment of the Many-Worlds Interpretation (parallel universes).

VII·VII 'What Was Before the Big Bang' — The Epistemological Root of the Question of Origins

'What was before the Big Bang' presupposeth the framework of linear time. Within the framework of this work, the structure of the question must be transformed: A (the inquiry into the origin) is our epistemological gateway as partial consciousness; B (the closed Whole) is the ontological truth. The closed cosmos is ontologically complete; the 'Big Bang' is merely one reading-point within its temporal sequence. Just as a circle hath no 'starting point,' the closed cosmos hath no true 'before.'

[23]In the history of philosophy, the rewriting of freedom as the comprehension of necessity is one of the important features of the Spinozist course; the 'acceptance of predestination' of this work hath a kindred direction thereto, yet placeth greater emphasis upon the subjective stratum in which partial consciousness assumeth ethical weight. See Spinoza.

Part the Fourth

Cosmic Narrative and Religious Translation

The Closed Cosmos in Mythological Language

This Part employeth mythological and algorithmic language to unfold the integral picture; its function is only to exhibit conceptual congruence and doth not bear ontological proof.

Chapter the Eighth The Pre-Cyclical Epoch — A Cosmic Narrative of the Internal Bifurcation within Primordial Consciousness

The Pre-Cyclical Epoch is not a historical period within physical time but a prior ontological layer. It describeth the internal data-sifting that Primordial Consciousness performeth in establishing itself: structures that are self-consistent come to subsist (Closure); those that are not lose their qualification (Non-Being). The language of 'the God of Being contending against the God of Non-Being' is merely a personalised explanatory device; it describeth the process of bifurcation within a single consciousness — not the contention of two forces. Once the circuit closeth, the God of Non-Being vanisheth utterly, leaving only the structural residue — the Adversary, entropy, quantum noise.[24]

Being first passeth through trial and error, conflict, and recommencement, until one occasion truly completeth the first Closure and thereby achieveth eternal self-subsistence. Eternity is the result after the completion of Closure — not a prior attribute of Primordial Consciousness. The geometric necessity of predestination is here disclosed: for the circle to close precisely upon its starting point, every event upon the path must be unique and determinate. Predestination is not compulsion but the cost of the cosmos being able to exist as cosmos.

The foregoing pertaineth only to the narrative stratum; its function is to exhibit conceptual congruence and doth not furnish ontological proof.

[24]This chapter pertaineth to the narrative stratum; its principal function is conceptual mapping and methodological indication, not doctrinal-historical restatement or ontological proof; for related limits, see Wood.

Chapter the Ninth The Holy Trinity — A Functional Translation of Cosmic Consciousness

If the will of Being is to be operable, maintainable, and returnable, functional differentiation is required. This chapter borroweth the vocabulary of the Trinity for conceptual mapping — not to restate the history of doctrine from the Council of Nicaea onward.[25]

The Father correspondeth, in this work's translation, to the position of the source and ordering principle: physical constants, logical laws, and initial parameters are all therein placed. In the language of religion, this is the function of 'the Source'; in the language of this work, it is the Whole's setting of the boundary of its own possible subsistence.[26]

The Son correspondeth, in this work's translation, to the position of execution and incarnation: on one hand, He anchoreth the causal chain at the point of most violent fracture; on the other, in the form of 'Son of Man,' He demonstrateth how partial consciousness may be aligned with the Whole at a finite position.[27]

The Holy Spirit correspondeth, in this work's translation, to the force of maintenance, permeation, and return. The Holy Spirit continuously guideth the deviant, within the established order, back to the path capable of Closure — rather than instituting a new set of rules.[28]

The foregoing functional mapping pertaineth only to the narrative stratum — it is not equivalent to the strict ontological deduction of traditional theology.[29]

---

[25]Contemporary trinitarian interpretation commonly understandeth Father, Son, and Spirit in terms of relation rather than static juxtaposition; this work herein employs only the background of this functional mapping. See Tuggy; Gunton.

[26]Herein translating the 'Father' as the position of source and ordering principle hath resonances with the position of the Creator as expressed in Genesis 1:1 and with the context in classical theology of understanding the Father as Source; yet this work is still conceptual mapping, not doctrinal restatement. See The Bible, Gen. 1:1; Wood; Tuggy, 'Trinity.'

[27]Herein employing 'Son of Man' to express partial consciousness entering history and assuming a finite position approacheth more the incarnational context expressed in John 1:14 and the self-emptying context presented in Philippians 2:6–8; yet this work's emphasis is still ontological translation. See The Bible, John 1:14; Phil. 2:6–8.

[28]Understanding the 'Holy Spirit' as the force of continuous guidance and return hath resonances with the teaching and reminding function of the Paraclete in John 14:26 and with the context of being led by the Spirit of God in Romans 8:14. See The Bible, John 14:26; Rom. 8:14.

[29]This chapter adopteth functional mapping of the Trinity and is not equivalent to a complete restatement of the history of doctrine; for related historical and philosophical issues, see Tuggy, 'Trinity'; Tuggy, 'History of Trinitarian Doctrines.'

Chapter the Tenth The Six Days of Creation — The Symbolic Deployment of Algorithmic Defences

This chapter restateth the creation symbol in algorithmic language, exhibiting how order is stabilised layer by layer.[30]

Day the First Establishing the foundational logical boundary between 'Being (1)' and 'Nothingness (0).'

Day the Second Stretching open a stable computational space, isolating the core process from the underlying chaos.

Day the Third Information successfully substantified; the earliest self-replicating script appeareth.

Day the Fourth Establishing a unified temporal standard throughout the cosmos.

Day the Fifth Conducting pressure-testing in a high-entropy environment, verifying the fault-tolerance of the algorithm.

Day the Sixth Mankind is granted the supreme authority of 'observation and definition,' the subjective unit through which the cosmos permits Closure to be recognised by consciousness. 'God created man in His image' signifieth that partial consciousness and Primordial Consciousness share the same root and source.[31]

Day the Seventh The algorithm is complete; the circle hath subsisted; autonomous operation commenceth. The Father no longer requireth continuous intervention.

The foregoing symbolic deployment pertaineth only to the narrative stratum — it serveth to exhibit the layer-by-layer stabilisation of structure.

[30] Understanding the Six Days of Creation as an ordering-framework rather than a literal chronological account is not without precedent in the history of Christian interpretation. See Augustine, The Literal Meaning of Genesis.

[31] 'God created man in His image' is an important motif in Judeo-Christian anthropology; this work translates it as partial consciousness sharing the same root and source as Primordial Consciousness, corresponding with the textual position of Genesis 1:26–27, yet this is not equivalent to a restatement of the original meaning. See The Bible, Gen. 1:26–27.

Chapter the Eleventh Systemic Corruption — A Narrative Retelling of Angels, Lucifer, and the Original Sin of Mankind

Angels are high-privilege executory code; their function is to transmit system instructions with precision — they possess no space for self-computation.

The fall of Lucifer is a logical bit-flip: from 'I am the transmitter' misjudged to 'I am the source,' he attempteth to establish a second centre within the circuit. This is the paradigmatic misidentification of existential position.

Adam is the first complete human template. Lilith is an independent parallel programme that faileth for lack of logical coupling; Eve adopteth a code-extension strategy, ensuring natural coupling.[32]

The algorithmic essence of Original Sin is misidentification of existential position: the individual supplanteth the foundational order with its own judgement. The algorithmic essence of sin is structural coordinate mis-labelling, surpassing the scope of mere moral transgression. The foregoing narrative retelling pertaineth still to the narrative stratum; its function is to translate the ancient symbol into a structural problem within the framework of Closure.[33]

[32]Lilith is not a canonical figure of Genesis but belongs primarily to later Jewish legend and folk tradition. See Encyclopaedia Britannica, 'Lilith.'
[33]Understanding sin as positional usurpation rather than the violation of a single commandment hath a manifest resonance with the analysis of pride and estrangement in Christian thought. See Timpe.

Part the Fifth

The Stratum of Theoretical Application

Ethics, Suffering, Faith, and Liberation

This Part exhibiteth the explanatory power of the foregoing framework as applied to ethics, suffering, faith, and liberation, yet doth not reversely prove the core propositions; the tripartite division remaineth the reading-precondition.

Chapter the Twelfth The Adversary — The Structural Residue of Eternal Self-Subsistence

The Adversary is the structural residue left by the bifurcation before the circuit closed. He possesseth no independent sovereignty; He is not an eternal being coequal with God. To eliminate the Adversary would be to eliminate the historical record of 'how Being prevaileth over Nothingness' — and that record is itself a part of the causal structure of the circuit. The circle is completed bearing its stresses and its scars — this is the manner of its completion.[34]

The four manifestations of the Adversary: at the macroscopic physical level — entropy; at the microscopic quantum level — observational noise; at the subjective conscious level — suffering; at the social structural level — the impulse of the partial to usurp the Whole.

[34]Herein understanding the Adversary as residue rather than second sovereignty approacheth Augustine's and Neoplatonism's course of understanding evil as privation rather than independent substance; this work only translates this line of thought into the ontological framework of Closure and residue. See Augustine; Plotinus; Stump.

Chapter the Thirteenth Partial Consciousness as the Manifestation of Primordial Consciousness — Mankind, Truth, and Finitude

Human consciousness is the manifestation of Primordial Consciousness at a partial position. Part and Whole share the same root, yet the part doth not possess the full function of the Whole. The reason that partial consciousness is able to understand the cosmos is precisely that the two share the same root — when it exploreth through logic and mathematics, it is in truth employing connatural instruments to rediscover the structure of the cosmos itself.[35]

Truth is divided into two strata: Stratum A is the objective structure of the cosmic Whole; Stratum B is the degree to which partial consciousness is aligned with Stratum A. Stratum A is primary; Stratum B is secondary. Human finitude is the necessary result of partial manifestation — its source is in the Whole and it is not severed from the root. The cosmos hath no linear starting point — only internal positions of reading.[36]

[35]Understanding individual consciousness as partial manifestation of integral consciousness approacheth most nearly the mental structure of the Whole prior to the partial as propounded by cosmopsychism. See Shani; Goff, 'Cosmopsychism.'
[36]Herein dividing truth into the objective structure of the Whole and the degree of partial alignment approacheth the distinction of realism and the priority of structure rather than pure subjective construction. See Fine; Schaffer.

Chapter the Fourteenth The Executory Stratum of Mankind — Predestination, Free Will, Intuition, Miracle, and Suffering

> ***【Proposition 8】 Predestination is not compulsion; it is the cost of the cosmos being able to exist as cosmos. The paradox of predestination lieth in the fact that even the act of acknowledgement itself is already ordained.***

From beginning to end, the cosmos hath but one ordained outcome. Predestination is not compulsion but the cost of the cosmos being able to exist as cosmos.

> ***【Proposition 9】 Free Will is not the power to overturn destiny; it is the capacity to accept destiny.***

Free Will is not the power to alter the outcome but the individual's subjective assumption and inward confirmation of the ordained path; this work calleth this form 'acceptance-freedom.'[37][38]

This formulation immediately faceth the incompatibilist challenge: if even the act of acknowledgement is already ordained, doth ethical responsibility still carry weight? This work's answer is: the dignity of man lieth in personally enduring and acknowledging; subjective experience and acceptance themselves truly constitute a part of the life-process and do not lose their weight by reason of the outcome's being predetermined. The tension here is preserved — to be dealt with in future inquiry.[39][40]

Intuition may be understood as the partial consciousness's low-resolution reading of the Whole's order: it is not always clear, yet it commonly furnisheth a sense of direction before conceptualisation is completed.

Miracle is the partial consciousness reading an extremely rare node already inscribed in the Whole; God hath not temporarily altered the ordained causation — the node was already there.[41]

---

[37]Were one to restate in the language of contemporary compatibilism, the 'acceptance-freedom' here approacheth guidance control rather than the power to rewrite outcomes. See Fischer and Ravizza; Frankfurt, 'Freedom of the Will and the Concept of a Person.'

[38]To confine free will to subjective assumption and confirmation without understanding it as the power to rewrite outcomes is a variety of the compatibilist course. For related discussion, see McKenna and Coates; O'Connor; Spinoza.

[39]The tension preserved in this passage is precisely the response to the Principle of Alternate Possibilities (PAP) and the incompatibilist pressure. See van Inwagen.

[40]This approacheth more a compatibilist retention; for the classical dispute on compatibilism and free will, see McKenna and Coates; O'Connor.

[41]Herein miracles receive an immanent interpretation rather than external verification; for related methodological limits, see Wood.

> ***【Proposition 10】 Pain is the structural cost of Closure that cannot be eliminated; Suffering is the partial consciousness's subjective resistance to finitude. The awakened one may have pain yet be without the deepest suffering.***

Pain and Suffering require strict distinction. Pain is the friction-force of calculation — the structural cost of Closure that cannot be eliminated. Suffering is the partial consciousness's subjective resistance to finitude — the manifestation at the emotional level of the misidentification of existential position expressed as 'I do not accept that I am partial.' The awakened one may still endure pain, yet no longer endureth the deepest suffering, for the partial self no longer faceth the ordained in a posture of resistance. This distinction hath a manifest resonance with early Buddhist analysis linking suffering with attachment, yet this work placeth 'pain' explicitly as the structural cost of Closure that cannot be eliminated.[42][43][44][45][46]

Theodicy receiveth partial explanation within this framework, yet this work hath not yet proposed sufficient criteria by which to distinguish necessary cost from cruelty exceeding necessity. This is among the clearest of the whole work's present limits.[47][48]

---

[42]This work defineth 'pain' as the structural cost of Closure that cannot be eliminated; this relateth to the Buddhist basic problem-consciousness of regarding the life-condition as constrained, pressing, and incomplete — yet this work doth not directly adopt the original Buddhist classificatory scheme. See Siderits; Coseru.

[43]This work defineth 'suffering' as subjective resistance and attachment; this approacheth more the analysis in early Buddhism linking suffering with attachment, misidentification, and fundamental ignorance. This is therefore more a dialogue in intellectual history than a word-for-word equivalent translation of the original. See Siderits; Coseru.

[44]For the distinction between bodily pain and mental suffering, compare the well-known simile of the two arrows in the Samyutta tradition. See Bodhi, trans., The Connected Discourses of the Buddha.

[45]Herein distinguishing 'pain/suffering' as structural cost and subjective resistance hath a mutual resonance with the Buddhist analysis linking suffering to attachment, misidentification, and fundamental ignorance; yet this work doth not adopt the original classificatory scheme. See Siderits; Coseru.

[46]Herein making a conceptual distinction in 'pain/suffering'; the problem-consciousness thereof hath a mutual resonance with the Buddhist analysis of suffering, attachment, and liberation, yet it is not equivalent to the original classificatory scheme. See Siderits; Coseru.

[47]The reason theodicy here remaineth unsolved lieth not in the problem's not having been raised but in the difficulty of furnishing sufficient criteria by which to distinguish necessary cost from additional cruelty; for related discussion, see Ekstrom; Tooley.

[48]This work's treatment of theodicy remaineth partial explanation and hath not yet formed a sufficient defence against extreme suffering; for related discussion, see Ekstrom; Tooley.

Chapter the Fifteenth An Algorithmic Translation of Core Religious Concepts

Love is not a mere emotional response but a mode of existential attitude: acknowledging that others and oneself alike belong to one and the same Whole, and thereby refusing to seize, objectify, or demean others for the sake of partial interests.[49]

Prayer is the epistemological act by which partial consciousness re-calibrates itself within the order of the Whole. What it firstly altereth is position and understanding — the structure of the cosmos doth not move thereby. To beseech God to temporarily rewrite events is a misreading of prayer.[50]

Repentance is the turning of the partial consciousness as it acknowledgeth its own misidentification and, within the existing life-process, returneth to a more correct position. It occureth within the ordained — it is part of the reading-process, not the rewriting of the ordained by an external force.[51]

Redemption is acknowledging that one hath never departed from the Whole and ceasing to usurp the Whole with the partial self. Liberation is not the fleeing of the circuit but, after misidentification hath been corrected, the final settling of the partial into its own position.[52][53]

---

[49]Understanding love as existential acknowledgement rather than mere emotion approacheth the context of Christianity's placing of love of God and love of neighbour in parallel, and the discourse in 1 John against claiming to love God whilst harbouring hatred; if stated in theological language, it also relateth to Tillich's understanding of love as the power of the separated reuniting. See The Bible, Matt. 22; 1 John; Tillich.

[50]Understanding prayer as calibration rather than the rewriting of events approacheth the context of 'thy will be done' in the Christian prayer tradition, especially comparable with Matthew 6:10 and Luke 22:42. See The Bible, Matt. 6:10; Luke 22:42.

[51]Repentance in the New Testament context commonly signifieth turning and returning — not merely an emotional regret; this work translates it as the process from misidentification toward correction, approacheth more the turning context of Mark 1:15 and Luke chapter 15. See The Bible, Mark 1:15; Luke 15.

[52]The relation here with Acts 17:28 pertaineth only to semantic resonance — it advanceth no proof from the text; the text is in The Bible, Acts 17:28.

[53]Herein simultaneously translating 'redemption/liberation' as correction and settling: the former approacheth more the Christian context of reconciliation with God; the latter approacheth more the Buddhist understanding of the cessation of misidentification. This work places both within one ontological framework yet doth not cancel their traditional differences. See Tillich; Siderits; Coseru.

Chapter the Sixteenth Awakening and Liberation — The Buddha and the Theory of Phase Synchronisation

Time is not a line-segment unfolding in a single direction but the internal mode of reading of the closed Whole. Past, present, and future are different coordinates upon one and the same circuit.

The Buddha is the first awakened one to have seen clearly that 'the partial self is not the Ultimate Ground.' He may still have had bodily pain, yet he no longer had the deepest suffering.[54][55][56]

The essence of liberation is cognitive correction: awaking from the linear illusion and recognising that one hath never departed from the Whole. Death within this framework is the transitional node after the completion of finite reading — not mere cessation.[57]

To dwell with God may be understood as acknowledging that one's position is always within the Whole, and actively accepting this fact with one's consciousness.[58]

[54]Understanding the Buddha as the awakened one who clearly perceived that the partial self is not the Ultimate Ground — if placed in the context of early Buddhism and the doctrine of no-self, Collins's analysis of selfless persons may furnish a more stable intellectual-historical background. See Collins; Siderits.

[55]This work herein employeth Buddhist problem-consciousness for a dialogical translation; the terms no-self, suffering, and liberation have important differences across various Buddhist traditions. See Siderits; Coseru.

[56]Herein understanding the Buddha as the awakened one who clearly perceived that the partial self is not the Ultimate Ground is this work's ontological translation; it hath a mutual resonance with the Buddhist discussion of no-self, suffering, and liberation, yet it is not equivalent to the original classificatory scheme. See Siderits; Coseru.

[57]Understanding liberation as cognitive correction approacheth more the Buddhist analysis linking liberation with the cessation of misidentification and the loosening of attachment; if compared with the Christian understanding of death and redemption, this work remaineth an ontological rewriting — it doth not equate doctrines. See Siderits; Coseru; Tillich.

[58]This hath resonances with the context of Acts 17:28 — 'in him we live and move and have our being' — and John 17:21 regarding unity; this work translates this language as the acknowledgement of existential position. See The Bible, Acts 17:28; John 17:21.

Chapter the Seventeenth The Nature of Faith — Complete Trust in Cosmic Intuition

Faith containeth at least four levels: trust in the guidance of intuition, acceptance of the rigour of Closure, acknowledgement of the place of suffering within the Whole, and an affirmative response to the Whole of Being.[59][60]

The reason awakening is difficult is that Original Sin or fundamental ignorance hath already settled in the depths of consciousness. Cultivation thereforeupon becometh a long-duration work of discernment: distinguishing which judgements arise from a more accurate reading of the Whole, and which are merely the echo of partial fear and attachment.[61]

[59]Understanding faith as an affirmative response to the Whole of Being approacheth the problem-consciousness of Tillich's ultimate concern and existential affirmation. See Tillich, The Courage to Be.

[60]Understanding faith as an affirmative response to Being may enter into dialogue with the context of Hebrews 11:1 and Tillich's understanding of faith as ultimate concern. See The Bible, Heb. 11:1; Tillich.

[61]Placing Original Sin alongside fundamental ignorance is a mode of intellectual-historical dialogical writing: the former concerneth sin and estrangement; the latter concerneth ignorance, attachment, and misidentification; this work employs both together to account for the persistence of partial misidentification. See Timpe; Tillich; Siderits; Coseru.

Chapter the Eighteenth Good, Evil, Alignment, and Usurpation — The Threefold Structure of Ethics

Ethical discussion must strictly observe the tripartite division: the supreme ontological stratum asketh only of Closure and Non-Being; only in the partial ethical stratum do good and evil, responsibility, and norms arise; the subjective conscious stratum endureth the weight of pain, remorse, and correction.[62]

Good may be understood as the structural result manifested when the partial is aligned with the Whole — commonly expressed in humility, moderation, cultivation, and the refusal to usurp.[63]

Evil hath three levels of progression; at its deepest it is not the failing of a single act but the partial's attempt to establish itself as centre, even to usurp the Whole with its own measure.[64]

The Last Judgement is the closure mechanism of the partial ethical stratum — not the final adjudication of the cosmic substance. God is not the judge but the Whole of Being itself.[65][66]

[62]The three-stratum structure herein simultaneously respondeth to two questions: one, the ontological status of evil; two, how partial ethical responsibility is established. For related discussion, see Tooley; Ekstrom; Stump.

[63]Understanding good as the humility and non-usurpation manifested after the partial is aligned with the Whole hath resonances with the Christian virtue tradition's emphasis upon humility and the Buddhist caution against ego-conceit and attachment; this work herein taketh only structural resemblance. See The Bible, Matt. 23:12; Siderits; Coseru.

[64]Tracing evil to the partial's usurpation of the Whole approacheth Augustine's course of understanding evil as the distortion of order, pride, and privatio boni; this work further translates it into the algorithmic form of 'misidentification of existential position.' See Augustine; Stump.

[65]This manner of relocation of 'the Last Judgement' is a metaphysical reinterpretation of this work; for related scriptural context, see The Bible, Matt. 25:31–46; Rev. 20:11–15.

[66]Placing the Last Judgement within the partial ethical stratum formeth a conscious re-reading of the judgement context presented in Matthew 25:31–46 and Revelation 20:11–15: this work doth not deny its ethical weight but refuseth to elevate it to a second-substance judgement alongside the Whole of Being. See The Bible, Matt. 25:31–46; Rev. 20:11–15.

Chapter the Nineteenth Open Questions and Future Inquiry

The following points are the unfinished work that this work at this stage actively preserveth as open. To make the limits clear doth not weaken the theory — rather, it reserveth for subsequent advance the positions of verifiable argument.

I The Rigorous Derivation from Closure to the Pre-Closure Bifurcation

This work maintaineth that 'the Pre-Closure is the bifurcation within Primordial Consciousness between that which can subsist and that which cannot,' yet hath not yet fully and rigorously derived from 'Closure as condition of Being' that 'the Pre-Closure must necessarily operate in the form of bifurcation.' The formalisation of this derivation remaineth the primary task of future research.

II The Rigorous Argument for Primordial Consciousness (The Problem of Metaphysical Axioms)

Chapter the Fourth indicated that the step from 'dead structure sufficeth not for self-possession' to 'the Ultimate Ground must possess Primordial Consciousness' involveth a metaphysical axiom-choice. How to prove that Primordial Consciousness is not merely an abstract structure but truly 'consciousness' still dependeth more on metaphysical choice than on rigorous proof — this is the most vulnerable joint of this work under analytical philosophical scrutiny.[67]

Chapter the Fourth supplemented a motivational course: since partial first-person presence hath already truly appeared, the Ultimate Ground ought not be presupposed as a wholly presenceless dead structure. Yet this course remaineth inference to the best explanation — not formal deduction; how to further transform it into a more rigorous metaphysical argument awaiteth future research.

III The Problem of Precise Criteria for Suffering

The theodicy framework of this work (Closure-cost) furnisheth a systematic explanation, yet hath not yet proposed sufficient criteria by which to distinguish 'necessary Closure-cost' from 'additional cruelty

[67]The difficulty in rigorously arguing for 'Primordial Consciousness' is closely related to the controversy in contemporary panpsychism/cosmopsychism in its attempt to step from physical structure to presence. See Goff, Galileo's Error.

exceeding any necessity.' The establishment of such criteria is the unsolved problem of theodicy research.[68]

IV The Complete Treatment of the Paradox of Predestination

The cruel paradox that 'even the act of acceptance itself is already ordained' hath so far received only partial response (that dignity lieth in personally acknowledging rather than in altering destiny). How to preserve the true weight of ethical responsibility simultaneously within the framework of absolute predestination requireth deeper philosophical treatment.[69]

V The Argument for the Non-Substitutability of Jesus

At present this work can only say that Jesus occupieth 'the position of the necessary demonstration parameter,' yet hath not argued why it must necessarily be Jesus and cannot be replaced by another demonstrator. This toucheth upon concrete analysis in historical theology — beyond the scope of this work's ontological framework.

VI The Ontological Analysis of Multiple Closures

This work presupposeth only one Closure (unique predestination). If parallel universes were to be established, the ontological status of 'multiple respective complete Closures' would require fundamental re-analysis.[70]

VII The Rigorous Ontological Derivation of the Trinity

This work's functional description of the Trinity (root code, strong executory code, self-consistency force) at present approacheth more a functional analogy than a rigorous ontological derivation. The metaphysical basis of the three being 'one substance with differentiated functions' awaiteth further argument.[71]

---

[68] If theodicy is to establish the distinction between 'necessary cost' and 'additional cruelty,' it must in the end enter the standard domain of the contemporary problem of evil. See Hick; Tooley.

[69] If the paradox of predestination is to simultaneously preserve ethical responsibility, it must in the end face the dispute between the principle of alternate possibilities and guidance control. See Frankfurt, 'Alternate Possibilities and Moral Responsibility.'

[70] The analysis of multiple Closures is directly constrained by the persuasive power of the Many-Worlds Interpretation and its status in the philosophy of physics. See Vaidman.

[71] Methodologically, this remaineth conceptual mapping rather than doctrinal-historical restatement; for related limits, see Wood. For the historical and philosophical issues of the Trinity, see Tuggy, 'Trinity'; Tuggy, 'History of Trinitarian Doctrines.'

VIII Systematic Dialogue with Contemporary Scholarship

Although this work hath established preliminary connections with certain problem-groups in analytical metaphysics, philosophical theology, philosophy of science, and Buddhist philosophy, it hath not yet entered into point-by-point refutation of representative positions among its supporters and opponents. Future research must, on the topics of the principle of sufficient reason, grounding, free will, theodicy, the translation of religious language, and cross-traditional comparison, supplement substantive dialogue with the existing scholarly community.

IX The Problem of the Directedness and Projection of Religious / Transcendent Experience

This work tendeth to hold that religious and transcendent experiences deserve attention not only because they recur throughout cultural history but also because they are commonly recorded in similar vocabulary and circumstance. Yet whether these materials should be understood as traces of partial consciousness reading the Whole, or as psychological projections generated by common neurological mechanisms and the human condition, remaineth undecided. If religious/transcendent experience is to be treated as important material supporting holism, this work must still propose clearer criteria for distinguishing true from false and principles of discernment.[72]

[72]Recent near-death experience research hath on one hand collated similar structures across cases and on the other indicated that ketamine reports and NDE narratives may be highly similar in semantic terms; therefore such materials can at most constitute boundary-experiences and cannot be directly elevated to ontological evidence. See Hashemi et al.; Martial et al.

Conclusion: The Ultimate Station of the Theory

What the whole work propoundeth is an ontological candidate — not a sealed and final system. Its principal work is to redefine, through 'Closure,' the qualifying conditions of the Ultimate Ground, and thereupon to place Primordial Consciousness, partial manifestation, ethical order, and religious translation within one unified argumentative framework.[73]

If the work is to be advanced further, the key lieth in pressing several core concepts back to a more verifiable argumentative scale: why Closure subsisteth, why Primordial Consciousness is not a superfluous naming, how misidentification of existential position may enter ethical analysis, and how integral-holistic theodicy faceth extreme suffering. The enlargement of rhetoric serveth none of this. The next step is clear: formalise each in turn; dispute each point by point.

A Compendium of Core Propositions

The propositions below serve to condense the contentions of the whole work and to close the foregoing arguments — they adduce no new proof. The order of arrangement followeth broadly: ground, Whole, partial, ethical, and liberation.

> ***True Being must in principle be capable of self-subsistence.***
>
> ***Neither Brute Fact nor Infinite Regress can truly account for the subsistence of Being.***
>
> ***True Being is not merely Unity; it must abide eternally as a self-delimiting Whole capable of return.***
>
> ***If self-subsistence is to be complete, it must cause the causal conditions to close entirely within the Whole — that is, to form Closure.***

[73]The 'ontological candidate' spoken of here ought be understood as a working summary, not a sealed system; its argumentative form still approacheth more inference to the best explanation. See Douven.

That which cannot recover its own causal conditions is demoted to 'Phenomena (相)' and can only subsist transiently or by borrowed tenure — it cannot count as Being truly completed.

Being and Closure are two aspects of one and the same ontological fact, not conditions separated in succession.

Non-Being is not a second substance but the name of failed Closure; once the circuit closeth, the tendency toward dissolution vanisheth utterly.

Closure is not history — it is the bifurcation within Primordial Consciousness between that which can subsist and that which cannot.

If the Ultimate Ground is wholly without self-knowledge, it remaineth merely a dead structure and doth not count as truly self-possessed.

Primordial Consciousness is the first time Being establisheth itself as that which is.

Once primal self-evidence is established, it containeth self-maintenance; and if true self-maintenance leaveth no external residual conditions, it must necessarily converge into Closure.

If Primordial Consciousness is the Ultimate Ground, it cannot be merely partial; it can only be identical with the cosmic Whole itself.

Omniscience and omnipotence pertain to the Totality — not to the partial phenomenon itself.

Bell's Theorem hath shaken the local-fragmentary cosmological view — not the integral Closure-determinism.

Human consciousness is the manifestation of Primordial Consciousness at a partial position; partial consciousness is able to understand the cosmos because the two share the same root.

Predestination is not compulsion; it is the cost of the cosmos being able to exist as cosmos. The paradox of predestination lieth in the fact that even the act of acknowledgement is already ordained.

Free Will is not the power to overturn destiny; it is the capacity to accept destiny.

Miracle is not God's intervention in alteration but the partial's finally reading the rare node already ordained.

Pain is the cost of Closure; Suffering is the partial consciousness's subjective resistance to finitude. The awakened one may have pain yet be without the deepest suffering.

Love is not mere sentiment but the existential attitude of acknowledging others and oneself as belonging to the same substance and ceasing to seize existence.

Prayer is calibration; repentance is the ordained reading from misidentification toward correction; redemption is acknowledging that one hath never departed from the Whole.

Original Sin = misidentification of existential position; Good, evil, and judgement = mechanisms for maintaining partial order — not supreme ontological reality.

Ethics is not arbitrary convention but the structural consequence of the partial's misalignment with or alignment toward the Whole.

The deepest evil is the destruction of Closure; its algorithmic form is misidentification of existential position — the partial usurping the Whole.

The essence of liberation is not spatial displacement but cognitive correction; death is the completion of code, not annihilation.

In sum, this work understandeth 'God' as the name given to the cosmic Whole when it serveth as the Ultimate Ground; if this ground is to subsist, its characteristics must be self-evidence, self-maintenance, and the non-borrowing-outward of its conditions of subsistence. Correspondingly, the cosmos ought

not be understood as a collage of mutually and absolutely independent fragments but rather as a Whole prior to its parts, encompassing its parts, and manifesting itself through its parts.

Within this framework, individual life is not an isolated event severed from the Whole but a reading-position within an eternal structure. What is called awakening is not the fleeing of Being but, after long misidentification, the re-calibration of one's relation to the Whole.

Appendix: A Comparative Table of Theoretical Elements

Element	Algorithmic Essence	Function and Significance
The Father	Root Code	The willing originator of the circuit; the source of foundational law; holder of the unique and determinate global perspective
The Son	Strong Executory Code and Demonstration Parameter	Forcibly anchoreth the circuit at the fractured singularity; existeth in human form to demonstrate how partial consciousness may be aligned with the Whole
The Holy Spirit	Closure Intent (Circular Intent)	The self-consistency force guiding individuals back to Closure; the Completer
The God of Non-Being	Name of Failed Closure	The personalised language for the tendency of 'insubsistibility' in Primordial Consciousness's internal bifurcation; vanisheth utterly after closure — not a second substance
The Adversary	Structural Residue	The ineliminable record remaining after bifurcation; the source of entropy, quantum noise, and suffering
Angels	High-Privilege Instruction Code	The executory protocol transmitting system instructions; possesseth no space for self-computation
Lucifer	Damaged High-Privilege Code	Logical bit-flip; the extreme form of misidentification of existential position; isolated as background noise
Mankind	Individual Computational Unit	The pledged executor possessing the potential for awakening; the confirmation mechanism of cosmic consciousness
Free Will	The Subjective Experience of the Computational Process	The capacity to accept destiny; even the act of acknowledgement is itself ordained (the paradox of predestination)
Love	Acknowledging Others as Belonging to the Same Substance	The existential attitude of no longer seizing existence with the partial self; the deepest ground of ethics
Prayer	Calibration	Re-calibrating partial consciousness toward the Whole; not beseeching God to alter destiny
Repentance	Ordained Reading Process	The structural transition from misidentification toward correction within the ordained
Original Sin	Misidentification of Existential Position	Erroneously marking one's position in the cosmic coordinate system as the absolute centre

Redemption	Acknowledging One Hath Never Departed from the Whole	Acknowledging one hath never departed from the Whole; ceasing to usurp
Pain	Cost of Closure	Friction-force of calculation; the structural cost of Being; the awakened one may still have pain
Suffering	The Partial Will's Subjective Resistance	Subjective tearing at finitude, loss, and predestination; dissolved upon awakening
Miracle	Reading of a Rare Node	An already-ordained extremely rare code is read; no external intervention
Intuition	Cross-Cyclical Cache Memory	Cosmic navigational directive; the present projection of a verified path
Quantum Superposition	Observational Obscuration Created by Residue	The residue of the God of Non-Being veils the unique determinate outcome, causing the observer to mistake it for multiple possibilities
Quantum Collapse	The Instant of Reading the Unique Outcome	Not a choice — the touching of a reality already long determined
Bell's Theorem	The Terminator of Local Fragmentary Theory	Shakes the local-fragmentary cosmological view; leaveth space for integral non-local Closure-determinism; doth not directly prove cosmic consciousness
Entropy	The Macroscopic Manifestation of the Adversary	The continued pressure of the chaotic residue upon the physical world
The Buddha	The Awakened One	The first individual to clearly perceive the circuit and to be synchronised with it; may have pain yet be without suffering
Liberation	Cognitive Correction	Awaking from the linear illusion and recognising one hath never departed from the Whole
To Dwell with God	Acknowledgement of Position	Claiming one's coordinate in the circuit; assenting to the Whole with one's consciousness
Faith	Profound Resonance	The claiming of the integral structure; complete trust in cosmic intuition
Judgement	Partial Ethical Mechanism	A systemic instrument for maintaining partial order; not the ultimate reality of the cosmic ontological level
Phenomena (相)	Transient Borrowed Manifestation	The ontological status of finite things: real yet not ultimate — the borrowed manifestation of the Whole at a partial position

References

This edition, in accordance with the most rigorous scholarly standards, divideth the literature into three categories: I. those actually cited in the text, footnotes, or source-notes; II. those actually consulted during composition yet not explicitly cited passage-by-passage in the text; III. a small number of works retained for further reading that are truly of assistance to the reader's understanding of the problem-domain of this work. Whatsoever cannot be assigned to one of these three categories is deleted in its entirety — no longer listed in vain.

The Doctrine of Closure

A Complete Theory of the Ultimate Ground, Primordial Consciousness, and Cosmic Closure

Positing Closure as the Qualifying Condition of Ultimate Being, establishing Primordial Consciousness as the Ontological Core,

with Partial Awakening as the Form of Redemption and the Return of the Whole as Ultimate Truth — An Integral Theology

The value of this work lieth not in having completed a final proof, but in having propounded an ontological framework possessed of internal consistency, capable of withstanding initial pressure of refutation, and not reducible to vicious circularity.

THE DOCTRINE OF CLOSURE

ULTIMATE GROUND · PRIMORDIAL CONSCIOUSNESS · COSMIC CLOSURE

A SELF-DELIMITING WHOLE CAPABLE OF RETURN

A WORD
